Insect Damage Detection Report

Prediction Result: severe

Suggestions: STAGE: SEVERE DAMAGE Description: Large areas of leaves are destroyed or skeletonized. Insects are heavily present and the crop health is severely affected. Yield loss is very likely if treatment is delayed. Recommended Treatment: 1. Immediately remove heavily infected area. 2. Apply strong biological pesticides like Bacillus thuringiensis. 3. Spray recommended insecticides such as: - Spinosad - Chlorpyrifos - Imidacloprid 4. Repeat pesticide application every 5–7 days if infestation persists. 5. Use pheromone traps and light traps to reduce pest population. Emergency Control Measures: • Apply systemic insecticides as per agricultural guidelines. • Consult local agricultural extension services for proper dosage. Preventive Measures: • Deep ploughing after harvest. • Maintain proper crop spacing. • Destroy infected plant residues. • Implement Integrated Pest Management (IPM).
